

DDoS attack is an attempt to make a computer/machine unavailable to the intended users.

In a DoS attack, a hacker attempts to overload or shut down a service so that legitimate users can no longer access it

Typical DoS Attacks target web servers and aim to make websites unavailable.

No data is stolen or compromised, but the interruption to the service can be costly for an organization.

DENIAL OF SERVICE ATTACK

Perpetrators of DoS attacks typically target sites or services hosted on high-profile web servers .

The most common type of DoS attack involves sending more traffic to a computer than it can handle.

There are a variety of methods for DoS attacks, but the simplest and most common is to have a botnet flood a web server with requests.

Mobile Devices and applications began participating in DDoS attacks in 2003
