# DNS Hijacking

DNS hijacking is commonly used to redirect users to fake login pages for banks and other online services in order to steal their login credentials.

The attackers can then redirect communication to fraudulent sites.

DNS hijacking is commonly used to redirect users to fake login pages for banks and other online services in order to steal their login credentials.

DNS hijacking is commonly used to redirect users to fake login pages for banks and other online services in order to steal their login credentials.

How to Prevent DNS Hijacking:

Create strong passwords and keep them private

Monitor Whois and DNS for unauthorized changes

Lock your domains – ask for registrar/registry locks

Maintain copies of all registration documentation

Use SSL when you access your domain account
